

RISK MANAGEMENT IMPLEMENTATION REPORT
FOR INTEREST RATE RISK IN THE BANKING BOOK

Bank Name : PT Bank QNB Indonesia Tbk (individual)

Reporting Period : June 2024

Qualitative Analysis	
1.	<p>Explanation of how Bank defines IRRBB for risk measurement and control</p> <p>IRRBB refers to the risk to the bank’s capital and earnings arising from adverse movements in interest rates in the market. Bank QNB Indonesia (QNBI) categorizes IRRBB into three sub risk types:</p> <p>a) Gap Risk Risk arising from the difference (gap) in contractual maturity and/or repricing maturity between assets and liabilities (including off-balance sheet items) in the banking book.</p> <p>b) Basis Risk Risk arising the difference between interest rate basis used to price assets and liabilities.</p> <p>c) Option Risk Risk arising from optional elements embedded in assets, liabilities and/or off-balance sheet items, where customers can alter the level and timing of the cash flows.</p>
2.	<p>Explanation of risk management and risk mitigation strategies for IRRBB</p> <p>In carrying out risk management and risk mitigation for IRRBB, QNBI takes the following approaches:</p> <p>a) Gap Risk Management QNBI actively maintains the maturity gap and composition of interest rates charged on assets and liabilities in the banking book. If interest rates are projected to rise, QNBI increases the composition of assets with floating interest rates and funding with fixed interest rates, <i>vice versa</i>. If interest rates are projected to fall, QNBI increases the composition of assets with</p>

	<p>fixed interest rates and funding with floating interest rates.</p> <p>b) Basis Risk Management</p> <p>QNBI mostly uses benchmark interest rates such as JIBOR and SOFR to price large-scale corporate loans. However, funding for such loans are not priced based on the benchmarks, and therefore exposed to basis risk. To mitigate the basis risk, QNBI regularly evaluates funding interest rates to keep it in line with recent market developments.</p> <p>c) Option Risk Management</p> <p>QNBI mitigates option risk by applying penalty for early redemption of fixed-rate time deposits. An early withdrawal results in a significant penalty that deducts certain portion of the principal amount.</p>
3.	<p>Periodization of Bank IRRBB calculation and explanation of specific methods used by the bank to measure the sensitivity to IRRBB</p> <p>QNBI performs monthly IRRBB calculations as a part of internal monitoring. In addition, QNBI also performs quarterly IRRBB calculations in accordance with OJK Circular Letter No.12/SEOJK.03/2018 regarding Guidelines on the Standardized Approach for Measuring Interest Rate Risk in Banking Book for Commercial Banks.</p>
4.	<p>Explanation of the interest rate shock and stress scenarios used by the Bank for IRRBB calculation using EVE and NII methods</p> <p>QNB uses 6 (six) standardized interest rate shock scenarios EVE calculation and 2 (two) parallel shock scenarios for NII calculation in accordance with OJK Circular Letter No. 12/SEOJK.03/2018.</p>
5.	<p>Explanation of modelling assumptions used in the Bank's Internal Measurement System (IMS) that are different from modelling assumptions used in IRRBB calculation with a standardized approach</p> <p>QNBI uses standardized modelling assumptions according to OJK Circular Letter No. 12/SEOJK.03/2018. QNBI does not have any assumptions other than those stated in the regulation.</p>

6.	<p>Explanation of how Bank hedges IRRBB, including its accounting treatment</p> <p>QNBI performs natural hedging by maintaining the maturity gap of assets, liabilities, and off-balance sheet items in the banking book; interest rate levels; and types of interest rates charged on assets and liabilities in the banking book.</p>
7.	<p>Comprehensive explanation of primary modelling and parametric assumptions used in calculating ΔEVE and ΔNII</p> <p>a) In calculating ΔEVE, the commercial margins and other spread components have already been included in the calculation of principal and interest of assets and liabilities. Because they are already being part of the cash flow, commercial margins and spread components are no longer added to the discount rate.</p> <p>b) QNBI performs behavioural analysis using normal distribution method to estimate the timing of withdrawal from non-maturity deposit (NMD) according to each product type (current accounts, savings accounts, etc.) Each type of NMD will be slotted into a time bucket according to the estimated withdrawal timing.</p> <p>c) QNBI does not estimate loan prepayment rate, time deposit early withdrawal rate, or automatic interest rate option embedded in corporate customers. Early repayments or withdrawals made by customers with fixed interest rates are charged with significant penalty and therefore can be classified as assets or liabilities Amenable to Standardization.</p> <p>d) At the moment, QNBI does not have methodology to aggregate and measure correlation between interest rates of significant currencies.</p>
8.	<p>Other information</p> <p>The ΔEVE calculation of QNBI as of June 2024 is 3.95% of Tier I Capital, below QNBI's maximum internal limit of 10% and maximum Regulatory limit of 15%. According to market risk assessment result, QNBI's ΔEVE exposure is categorized as low risk. ΔEVE to Tier I Capital ratio has increased by 1.25% in June 2024 in comparison to the previous quarter, which stood at 2.70%. The largest exposure comes from "parallel up" shock scenario, valued at IDR - 167,629 million. This figure is deemed higher compared to the same scenario in</p>

	<p>the previous period, which was valued at IDR -113,449 million. The boost of ΔEVE was mainly driven by changes on repayment schedule with longer tenor on fixed interest rate starting in May 2024 amounting IDR 372.08 billion from a Corporate customer, as well as new loan drawdown to a Multifinance customer with the outstanding amount of IDR 293.75 billion. In addition to that, the increase of ΔEVE was also triggered by IDR 425 billion newly booked IDR BI Securities (SRBI) in 6-9 months bucket.</p>
Quantitative Analysis	
1.	<p>Average repricing maturity period for NMDs</p> <p>The average repricing maturity period for NMDs as of June 2024 is 24.16 days for IDR currency and 32.65 days for USD currency.</p>
2.	<p>The longest repricing maturity period for NMDs</p> <p>The longest repricing maturity period for NMDs as of June 2024 is 1.5 years.</p>

IRRBB CALCULATION REPORT

Bank Name : PT Bank QNB Indonesia Tbk (individual)
 Reporting Period : June 2024
 Currencies : Rupiah (IDR), United States Dollar (USD)

In IDR Millions	Δ EVE		Δ NII	
Period	T	T-1	T	T-1
Parallel up	-167,629	-113,449	-4,782	105
Parallel down	-1,939	-1,168	-45,000	-51,218
Steeper	-1,665	-1,043		
Flattener	-45,730	-45,419		
Short rate up	-124,394	-93,598		
Short rate down	-2,766	-1,691		
Maximum Negative Value (Absolute)	167,629	113,449	45,000	51,218
Tier I Capital (for Δ EVE) or Projected Income (for Δ NII)	4,243,858	4,199,542	496,200	516,081
Maximum Value divided by Tier I Capital (for Δ EVE) or Projected Income (for Δ NII)	3.95%	2.70%	9.07%	9.92%
